Touch Screen Data Entry Coming to SAMS

MJM Innovations is pleased to announce the expansion of its strategic partnership with Synergy Software Technologies of Essex Junction VT, for the integration of touch screen technology within the Synergy Suite. This important addition offers SAMS users the option to provide easy-to-use tools directly to clients for recording activities and reserving services. SAMScan Swipe with touch screens delivers the convenience of touch screen technology. Release is expected this summer.

“MJM Innovations is proud to join forces with Synergy on this exciting project,” said Jeffrey Venick, MJM Innovations’ President and CEO. “The combination of both companies and their expertise in aging services will only help enhance the existing Synergy Suite. Touch screen technology and electronic transaction processing is truly the wave of the future.”

"The Synergy team is excited to be planning the addition of touch screen technology," said Stan Eames, Synergy's President and CEO. "We are excited that Synergy and MJM have joined in what will prove to be a very popular addition to the Synergy Suite."

SAMS users will contract directly with MJM to integrate this technology with their SAMS system. MJM will provide setup and service for touch screens, as well as integration with the secure web servers, which will receive and process the transactional data. Synergy and MJM will setup the direct integration with SAMS. The touch screen model will eliminate the need for manual tracking of redundant data entry, improve quality of service, and reduce costs.

The swipe/touch screen technology is further enhanced with MJM Innovations’ Universal Participant Tracking Card (UPTCard™). The UPTCard™ is a proven system that electronically captures participant activities. It looks and feels like a traditional debit or credit card and can be used with MJM Innovations low cost terminals, placed in the area where data is collected. Program participants, volunteers and managers simply swipe their personal UPTCards™ to begin the process of automatic data collection. They will then choose services and activities via touch screen.

Benefits of this new technology include:

- Allows clients to record activities and services themselves
- Replaces manual paper systems with an electronic card and touch screen
- Easy to implement and cost effective
- Saves money by reducing administrative costs
- Provides tracking for program activity
- Offers detailed reporting and control features
- Reduces fraud opportunities
- Inexpensive equipment provided by MJM Innovations

- Enables users to accept credit cards and prepaid cards

About MJM

MJM Innovations is a management and technology firm that improves transportation, aging, and other programs through outsourced management services, card solutions and web-based software, driven by proven technologies.

About Synergy

Synergy's suite of products offers solutions for web-based or local client management, long term care data integration, care planning, assessments (on the web, on laptops and Pocket PCs), budget tracking, outcome measures, information & referral, nursing home complaint management, barcode scanning, and now UPTCards™.
